It is not possible for the DeskPRO upgrade process to be changing the PHP version being used. What are the symptoms you are using as evidence for this to happen

When I run the upgrade it doesn't ask for APC because I'm using wincache after the upgrade it asks because it's using a 5.3 no cache php version i have not the the 5.3 wincache version it was before the upgrade

Unless it's restarting the website or something, if it is then IIS maybe switching to my default PHP instead of the wincache one

Ok; this has nothing to do with switching PHP version; it's just that the admin interface is falsely suggesting you should install APC when you already have WinCache installed - we've improved the check so it's checking for either APC or WinCache so you won't see the .message any more. Fixed in next build
