Include custom HTML files or execute custom PHP files in templates

Christopher Nadeau - 2025-11-02 - ريايةات - Christopher Nadeau

.These options increase the power of the template system

:To use these options you need to enable a special option. Add this line to your config.php file

```
;DP CONFIG['enable include file'] = true$
```

Including a file in a template

:Use the include_file template function to include a file

.(The file will be included as-is (i.e., the contents are not filtered or executed in any way

Including and executing PHP in a template

:Use the include php file template function to include a PHP file

The file will be PHP $\underline{include()}$ 'ed into the template. This means the file will be executed as PHP and the contents .captured and inserted into the template

:You can pass template variables into the local scope by passing a second parameter
