## My custom report with a lot of fields is failing

[\(Creating Reports \(Old - تعليقات \(.\)](#) - Ben Henley - 2019-04-01

### :Question

I'm trying to run a custom report I made that retrieves a lot of different fields including custom fields I've created. Once I add more than a certain number of fields, my query fails with a "There is something wrong with your query" message. What's happening

### :Answer

DPQL queries with more than about 55 fields will fail due to a limitation in the underlying MySQL technology. If you need to retrieve a large number of fields, you will need to use the [Deskpro API](#)

.Note that you can retrieve all fields in a table with a wildcard, e.g

```
*.SELECT tickets
```

.but this will not work if you have added so many custom fields that you're running into the above issue
