## Reports widget override examples

[Reports](#) - [تعليقات \(٢\)](#) - Christopher Nadeau - 2025-11-25

.You can format charts in Reports v2 using JSON with our Widgets Override option

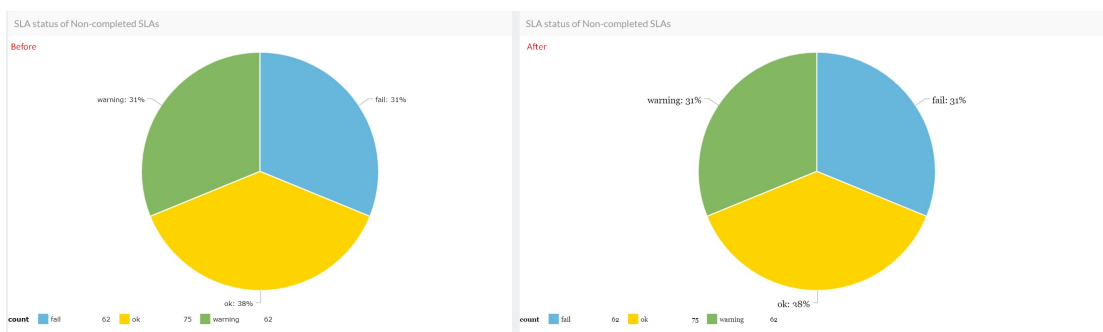

You can find the official documentation here: <https://docs.amcharts.com/3/javascriptcharts/AmChart> but we have included some examples below. You can see the differences in the pie chart after our custom JSON was added

Note

A detailed guide on how to customize the colour of charts can be found here: [Customizing the color of charts on custom dashboards](#)

:You can use the following format to change the font of the legend and labels of a pie chart (1

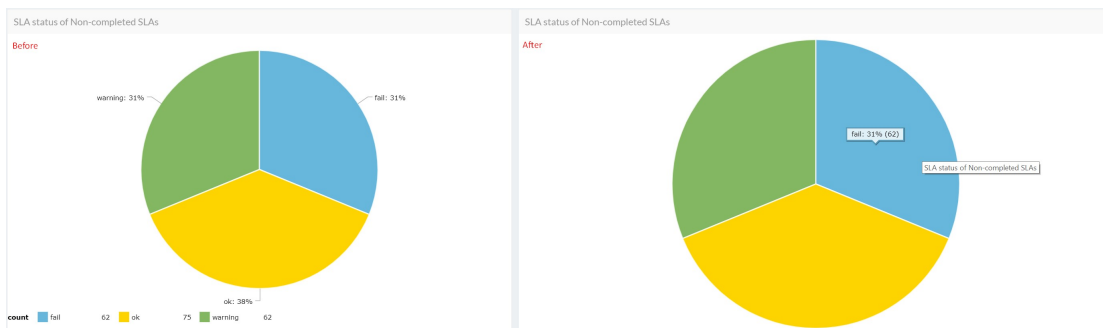

```
{fontFamily:"Georgia","fontSize":15"}
```

:Here we are removing the legend and labels from the pie chart (2

```
{legend":false,"labelsEnabled":false,"categoryAxis":{"labelRotation":45,"title":null"}
```

.Hovering your mouse over the chart allows the details to display

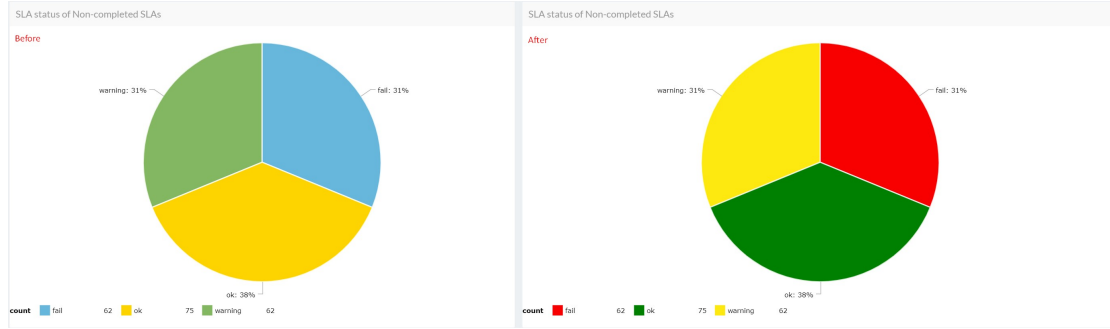

.More information about standard AmCharts options could be found [here](#)

.You may be particularly interested in: AmBalloon, CategoryAxis, ValueAxes, AmGraph, AmLegend or AmBalloon

:In the following example, we have customized the colors of the SLA categories in the pie chart (3

```
{"pieColors": {"ok": "#008000", "fail": "#f80000", "warning": "#fde910"}
```

Note: The AmCharts library states that the legend JSON tag is an Object. So, you need to specify your values {} within that JSON object. Like, {"legend": {"enabled": true
