Retrieving user hostname information in reports

Ben Henley - 2018-05-14 - يعليقات - Ben Henley

If you have the **Resolve User Hostnames** app installed, you can get hostname information for messages. This gives you insight into how users are connecting to the helpdesk, since the hostname often indicates the user's .ISP, university, section of your network etc

To retrieve a message hostname, use *tickets_messages.hostname*. Note that this is a field of the tickets_messages table, so you must select FROM tickets_messages, but you can use <u>cross-referencing</u> to include .fields from other tables

:Here's a simple example query to display hostnames for all user messages, split up by ticket

The hostname field will be empty for messages created before you installed the app. Specifying

'' <> WHERE tickets_messages.hostname

.means that messages where the hostname is empty are not listed $% \left\{ 1\right\} =\left\{ 1\right\} =\left\{$

Specifying

tickets_messages.person.is_user = 1

.in the WHERE clause filters out agent messages
