Deskpro AI Supported Models & Providers

AI - (.) تعليقات - Lara Proud - 2026-01-30

Deskpro AI supports a wide range of **Large Language Models (LLMs)** and **Embedding Models** across multiple providers, so you can choose the right option for your organization

We've tested these models extensively to ensure compatibility for both **prompting** (LLM-powered tasks like summarization and reply suggestions) and **embeddings** (semantic search and data retrieval)

This article lists all currently supported public and private models, along with guidance for supported AI models for Deskpro Cloud and Private

Understanding Prompting and Embedding Models

Prompting Model

A prompting model is like a translator for your request — it turns what you ask into clear, step-by-step instructions that the LLM can follow

Example: You say, "Write a friendly email to reschedule my dentist appointment." The prompting model reformats that request with tone and key points, and the LLM writes the email

Embedding Model

Embeddings act like "meaning fingerprints" for text. An embedding model converts your words and documents into numeric vectors, allowing the LLM to find relevant information even when different words are used

Example: You ask, "How do I get paid time off?" The embedding model retrieves the HR document that mentions "annual leave" and passes it to the LLM, so you get the correct policy in plain language

Deskpro Cloud

On Deskpro Cloud, you can choose from a range of public AI providers and configure your account directly in Deskpro, or use the Deskpro Managed AI Connection to get started instantly
