

## Webhook action data format

Deskpro API - (.) تعليقات - Ben Henley - 2022-05-05

Deskpro can use a **webhook action** as part of a trigger, escalation, SLA, or macro. The webhook action enables your helpdesk to interact with external services that accept commands using the web's [HTTP](#) protocol. This could be a third-party service that offers a .suitable API, or your own custom code

For example, you could use a webhook action to post a notice to your intranet when tickets .fail a certain SLA

You can choose the HTTP method used: for a POST, PUT or DELETE request, the HTTP request body will contain data about the ticket to which the action relates. (A GET request .(has an empty body

### Custom headers/data

You can send **custom headers or data**, which you define when you create the webhook action. You can use **variables** (using the [same syntax as for snippets or automated .\(actions](#)

:For example, when creating the webhook action you could enter a **Custom header** of

```
{{ X-Deskpro-TicketId: {{ ticket.id
```

Then the HTTP headers sent due to an action on the ticket with ID 5 would include "X- .Deskpro-TicketId: 5

Note that if you send a variable in a custom header but there is no value defined, instead of .sending a blank header, no header will be sent at all

Any custom data you send will be included in the "**custom\_data:**" parameter of the post body. This parameter is always present; if you have sent a variable without a value or not .defined any custom data, it will be empty

### Ticket data example

To view the data that a webhook action is sending and help with debugging, we recommend .using [RequestBin](#)

:This is the list of data for an example ticket

```
:[ticket[date_last_user_reply
```
