

## ?Why can't I add custom ticket statuses

Ticket Structure - تعليقات (.) - Chynah Hayde - 2023-09-07

In Deskpro, statuses track who needs to respond to the ticket next. The core statuses are **.Awaiting Agent, Awaiting User, Pending, and Resolved**

The helpdesk is set up to understand the default statuses, i.e., **Awaiting Agent** tickets need to be brought to the attention of agents. If you could add arbitrary custom statuses, it .would break the workflow

However, you can add [Custom Sub-Statuses](#) associated with a core status and behave the .same way on the interface as a core status

These can add more definition to a ticket and create more detailed reports while keeping .the built-in workflows that rely on the core statuses working

To create sub-statuses, go to **Admin > Ticket Structure > Statuses** and use the + **.New** button to create a new sub-status for your helpdesk

You can use [Tasks](#), [Triggers](#), [Escalations](#), etc., on your custom sub-statuses to make sure .that your tickets are always in the correct status
