

CC'd users are now listed in each email message

[Product](#) - [تعليقات \(٠\)](#) - Colin Dunn - 2019-09-02

It is important to know who is actually involved in your email conversations. Support tickets are extremely versatile, and while you can see the current recipients involved in an overall conversation with ease, it is less clear who your end users are including in their own email chains.

?What has been changed

We have resolved this issue by including a list of CC'd users not only in the ticket, but in each message. This way it is completely transparent who your end users are adding to the correspondence, and who they are choosing to exclude. This is delivered in the form of a neatly integrated bar at the top of each incoming email message - if the user has CC'd in extra recipients.

?When would we use this

In this given example, a ticket recipient has decided to exclude a person from their response, and has made his intentions clear that "Edison (t.ed@example.com)" should not be involved in future correspondence.

NOTE: The removed recipient cannot add themselves back in to the ticket - however a valid participant can add them in as a CC

If the removed recipient responds, this will be treated as a fresh email and will create a new `○`
`.ticket`

?How do we get started

.This feature will apply automatically after upgrading to 2019.7
