

## New Feature: "Resolve User Hostnames" App

Product - (.) تعليقات - Ben Henley - 2015-02-03

.Our latest update adds a new app to tell you more about how your users connect to you

You've always been able to see user IP addresses in DeskPRO, but a string of numbers like  
."192.38.119.79" doesn't tell you much at a glance

With the new **Resolve User Hostnames** app, your helpdesk shows you the hostname associated with each IP, giving you a clearer idea of where the user is connecting from. Just  
:mouse over a user message where the age of the message is displayed

You can also see hostnames on agent messages, so it's easy to find out if another agent is  
.logged in down the hall, or working from home

You can choose to add a Hostnames section to your tickets, showing details of user (and,  
:optionally, agent) connections

Hostname information is also accessible through DeskPRO's powerful [Report Builder](#), so you'll be able to analyse where your users are connecting from in as much detail as you need. Just use `tickets_messages.hostname` in your query. Here's an [example of a simple .report which retrieves hostname information](#)

If you want these features, you can install Resolve User Hostnames from **Admin > Apps** in .about a minute. See [this article](#) for details

If you're a DeskPRO Download customer, you'll need to update to the latest build to see the .app. If you're on DeskPRO Cloud, we've rolled out the update for you automatically
