

Can I include Satisfaction survey results in my reports?

Ben Henley - 2021-09-02 - Σχόλιο (1) - DPQL Examples

You can retrieve satisfaction ratings in your own custom reports.

For historical reasons the table that stores ratings is called **ticket_feedback** (but note that the satisfaction rating system is a completely separate concept from the Feedback section on the portal).

| Field Name | Data Type |
|----------------|----------------|
| date_created | datetime |
| id | number |
| message | string |
| message_id | number |
| person_id | number |
| rating | number |
| ticket_id | number |
| person | Person |
| ticket | Ticket |
| ticket_message | Ticket Message |

The possible values of *rating* are 1 (positive), 0 (neutral), -1 (negative).

Here's a simple example report:

```
SELECT ticket_feedback.id, ticket_feedback.rating
FROM ticket_feedback
WHERE ticket_feedback.ticket.date_resolved = %LAST_MONTH%
SPLIT BY ticket_feedback.ticket.agent
```

Here's a more advanced report which shows how many of each rating each agent received

last month:

```
SELECT DPQL_COUNT () AS 'NUMBER;  
FROM ticket_feedback  
WHERE ticket_feedback.ticket.date_resolved = %LAST_MONTH%  
SPLIT BY ticket_feedback.ticket.agent  
GROUP BY ticket_feedback.rating
```

The below report gives you access to the ratings and comments left:

```
SELECT ticket_feedback.id, ticket_feedback.date_created, ticket_feedback.rating,  
ticket_feedback.message  
FROM ticket_feedback  
WHERE ticket_feedback.ticket.date_resolved = %LAST_MONTH%  
SPLIT BY ticket_feedback.ticket.agent
```

Finally the report below gives you a matrix table containing a count per rating per agent. Note this uses the ticket messages table in the GROUP BY and WHERE clauses. This is because if we used the tickets field, if the agent was then changed after the satisfaction response was received, the satisfaction feedback would be assigned to the current ticket assignee. It also uses the replace functionality suggested in the comments section (thanks Kurt):

```
SELECT DPQL_COUNT()  
FROM ticket_feedback  
WHERE ticket_feedback.date_created = %LAST_MONTH% AND  
ticket_feedback.ticket_message.person.is_agent = 1  
GROUP BY DPQL_MATRIX(REPLACE(REPLACE(REPLACE(ticket_feedback.rating, '-1',  
'Negative'), '0', 'Neutral'), '1', 'Positive'), ticket_feedback.ticket_message.person)
```

Another example Deskpro assisted with...

Title:

Ticket Satisfaction <1:date group, default: this_month>

Query:

```
DISPLAY TABLE  
SELECT COUNT() AS 'Number'  
FROM ticket_feedback  
WHERE ticket_feedback.ticket.date_created = %1:DATE_GROUP%  
SPLIT BY ticket_feedback.ticket.agent
```

```
GROUP BY REPLACE(REPLACE(REPLACE(ticket_feedback.rating, '-1', 'Negative'), '0', 'Neutral'),  
'1', 'Positive') AS 'Rating'
```
