Why does my 1 day SLA have a failure date 3 days away?

Dan Baker - 2023-09-07 - [Comments \(0\)](#) - [Business Rules](#)

If you set up an SLA to fail after one day. But when you look at the failure date it can be more than a day away - sometimes 2 or 3 days.

The reason this happens is that the SLA runs within working hours, and you've set the ticket to fail after "1 day" has elapsed. Therefore, Deskpro interprets "1 day" as **24 working hours**.

Suppose your working day is 8 hours long, as set by your Business Hours in **Admin > Configuration > Business Hours**, and a ticket comes in first thing. The first day counts as 8 hours on the 'elapsed time' clock, the second day counts as another 8 (bringing the clock to 16), and the ticket fails on the third day after another 8 hours elapse and the required 24 working hours have passed.

To accomplish a **one working day SLA**, you should set the SLA to fail after the length of your working day in hours, not "1 day".

Example

If your working day is 8 hours long, you want the SLA failure to look like this:

The screenshot shows the 'Failure' configuration screen. At the top, it says 'Failure' with a circled '3' indicating three steps. Below that, a 'Then' section is shown with the text 'the following actions will run'. There are two dropdown menus labeled 'Select...' and a '+' button for adding more actions. The main configuration area shows 'After 8 hours' and a note: 'the ticket has failed and the failed status is applied.'
