

Configure a proxy server for HTTP requests made by Deskpro

Christopher Nadeau - 2021-07-06 - Comment (1) - Server Software

In some situations, Deskpro itself may make HTTP requests: Downloading updates, executing a webhook, consuming web APIs such as with the JIRA app, etc.

Starting with Deskpro v5.2.0, you can make Deskpro use a proxy server for these HTTP requests by editing `config/advanced/config.settings.php` and adding one of these three configuration variants:

```
$CONFIG['settings']['http_client.proxy'] = 'http://example:password@localhost:36879';
```

```
// optionally specify a list of hosts to NOT proxy
```

```
//$CONFIG['settings']['http_client.no_proxy'] = ['example.com'];
```

Do you need to restart deskpro after making these type of changes in config files ?
