Call a webhook in the criteria section of a trigger Collecting Feedback

- Eric Meiners
- **Nombre del foro:** #Feature Request

I'd like to be able to use a webhook in the criteria of a trigger.
For example, the trigger would first call a webhook, it would get a response back from the webhook, then the trigger would read the webhook response and check to see if field x from the response == y, then the trigger would perform an action based on if that's true or not.
It would also need to work alongside other criteria as well so that I could say if field x from the webhook == y AND if the department == z, then change the department to q.
