Question

Is there a method I can use to export my user data for use in MailChimp or similar ??

Answer

You can go to the Reports section **Stat Builder > Add** to export a list of users.

The following query will give you the users name, id, email address and organization.

```
SELECT people_emails.person.id, people_emails.date_created, people_emails.person,  
people_emails.email, people_emails.person.organization.name
```

```
FROM people_emails
```

```
WHERE people_emails.date_created = %THIS_MONTH%
```

You can change the time period under WHERE depending on what users you want to export e.g users that were created THIS_YEAR, LAST_MONTH etc.

This report will give you more information - all of the above plus their address and phone number

```
SELECT people_emails.person.id, people_emails.person, people_emails.email,  
people_emails.person.organization.name AS 'Organization Name',  
people_emails.person.contact_data.field_1 AS 'Address',  
people_emails.person.contact_data.field_2 AS 'City',  
people_emails.person.contact_data.field_3 AS 'State',  
people_emails.person.contact_data.field_4 AS 'Zipcode',  
people_emails.person.contact_data.field_5 AS 'Country',  
people_emails.person.phone_numbers.number AS 'Phone Number'
```

```
FROM people_emails
```

```
ORDER BY people_emails.person.id
```
