How to inspect AJAX requests with Chrome tools

Ben Henley - 2023-09-11 - Comment (1) - Deskpro Legacy

The Deskpro interface uses a web programming technique called AJAX to allow the pages to update dynamically without the need to refresh the whole page.

Sometimes a Deskpro support agent may ask you to inspect individual AJAX requests to help diagnose a problem.

Here's how to do this:

- 1. Use the <u>Chrome web browser</u>.
- 2. Open the Deskpro interface where there's a problem.
- 3. Within the Chrome menu system, select **More tools > Developer tools**.

				☆	
marks now	New tab New window New incognito window Ct			Ctrl+T Ctrl+N rl+Shift+N	
	History Download: Bookmarks	5		Ctrl+J	
	Zoom	Zoom - 100%		- 23	
	Print Find			Ctrl+P Ctrl+F	
Save page as Ctrl+S Add to taskbar	More tools				
	Edit	Cut	Сору	Paste	
Clear browsing data Ctrl+Shift+Del Extensions Task manager Shift+Esc	Settings Help				
Encoding •	Exit	Exit Ctrl+			
Developer tools Ctrl+Shift+I					

4. When the developer tools console opens, click on the Network tab, then click XHR

below.

5. You can now see the AJAX requests. The Deskpro agent has probably told you some steps to take and a particular request to look for. Click on an individual request to see the request details, which you should copy and send to Deskpro.

These steps helped us troubleshoot an annoying and elusive problem. Studing the AJAX calls, we were able to confirm that the problem was somewhat random, and hence not something in our Apache or Mod Security configuration. The culprit was a flood protection setting in our firewall that limited the number of concurrent connections to port 443 -- DeskPRO needed more connections, especially immediately after logging in.
