

Why I can't I see the automatic update button on the admin home screen?

Ben Henley - 2017-11-09 - Comments (0) - Deskpro Legacy

Question:

I don't see the automatic update button on the admin home screen. Why not?

Answer:

Run the [command-line updater](#) to get an error message explaining the problem.

A common cause is that your server cannot connect to our update server to download the update.

If you get a message that says "We could not fetch version information from our web server", you may need to open the SSL port (443) outbound to *.deskpro.com addresses.

In addition, check that the connection isn't being blocked by firewall/antivirus software, your SELinux configuration, etc.

If you're upgrading from a version before 410 on Linux and are getting SSL-related error messages, [see this article](#).

You may find that [manually updating to the latest version](#) restores the update button.
