JSONP support for API Collecting Feedback

Schat.net •

Forum name: #Feature Request •

Currently the application doesn't return properly structured JSONP responses. I have another application running on a different subdomain and need the ability to do cross domain requests. Looking through the source code it looks like there is no where in the code that is set to return the json padded with a function. The function is there but in the handling of requests it is hard coded to always return json without the padded callback function.

```
</pre></div>
```

/>
 }

 // Because IE will sometimes prompt to download json
when using iframe transport for ajax if we dont do this

 if (\$this->request-
>isXmlHttpRequest() || isset(\$_SERVER['HTTP_ACCEPT']) &&
(strpos(\$_SERVER['HTTP_ACCEPT'], 'application/json') !== false))
{

 \$response->headers->set('Content-Type',
'application/json');

 } else {

 \$response->headers-
>set('Content-Type', 'text/plain');

 }

 \$response->setStatusCode(\$status_code);

 if
(is_array(\$content)) {

 \$content = json_encode(\$content);

 }

 \$response->setContent(\$content);

return \$response;

 }

 The reason I am requesting this
update is because everytime I update the system I have to re-add the change.

.

 Thanks
