

Automated install on clean Ubuntu, Debian or CentOS

Ben Henley - 2017-11-09 - Comment (1) - Deskpro Legacy

There is an automated script available to quickly install Deskpro on popular Linux distributions

.See the "Automated install" section of the [On-Premise download page](#) to get the script

.Note that the automated install requires an internet connection to our servers

.This script is know to work on Ubuntu 14.04/15.04, Debian 8.1/8.3 or CentOS 7

You should only use this script if you are using a new, clean install. If you want to install Deskpro on a server that has already been configured to do other tasks apart from running Deskpro, **do not** use this script. Follow the [install instructions in the admin manual](#)

.You should use a server with at least 1GB of RAM
