How can I set up agent permissions, permission groups and ?department access

Eloise Rea - 2024-02-07 - Comment (1) - Admin

The Deskpro agent permissions system is designed to give admins granular control over what agents can see and do in the helpdesk. In this article, we'll explain how you can set up permissions for various different situations

Basic concepts

.Each agent account has a set of permissions which grant access to different functions

Under **Admin > Agents > Agent Profiles** you can grant permissions to each agent :individually

:Agents also have department permissions. There are two levels of department permission

Full access - means that agents has full visibility over tickets in a department •

Can assign to - means agents can assign tickets to the department, but not have • .visibility over the ticket once assigned to it

Permission Groups

To save time applying permissions to agents, you can create **permission groups** which will grant permissions to multiple agents at once. A permission group stores a set of permissions, and when you add an agent to the group, the agent is granted all those permissions. You can add an agent to more than one permission group

:There are two built-in permission groups

All Permissions - Agents in this group will have full access to the agent interface, • including access to all ticket departments

All Non-Destructive Permissions - Agents that are in this group will have nearly • full access to the agent interface, including access to all ticket departments. The only permissions that this group does not grant are those which allow certain destructive actions, such as irreversible delete operations

Permissions are additive

The key concept to remember is that **permissions are always additive**, whether you grant them through the agent's individual account or by adding the agent to a permission

.group

If you add an agent to 3 different permission groups, they will have *every* permission that is .granted by *any* one of their groups

You can't take away a permission on an agent's individual account that's been granted from a permission group. For example, here's the profile of an agent who's a member of the **All**.Non-Destructive Permissions group

×

The permissions granted through the group are shown as locked; you can't remove them individually (because permissions are additive) - so if you wanted this agent not to be able .to create new tickets, you'd have to remove them from the permission group altogether

However, you can *add* extra permissions to an individual agent's account. Because it's not .granted through a permission group, it's considered a **permission override**

Managing permissions with only a few agents

.The point of permission groups is to make it quicker to edit large numbers of agents

If you only have a few agents who need widely different permissions, there is no need to set .up permission groups. It's quicker just to edit permissions on each agents' profile

If you have a small number of agents who all need the same custom permissions, you could add them all to the same custom permission group. That way, if you decide to change your permissions policy, you can change all of them at once

Separate permission levels and department access

:Suppose your helpdesk is divided up like this

Different agents may need access to one or more of three departments: Sales, • Support and Accounts

:Agents include •

Trainees who need limited permissions o

Standard employees who need more permissions o

.Managers who need all permissions o

Clearly, it's impractical to make groups for Sales Trainee, Support Trainee, Accounts .Trainee, Sales & Support Trainees etc

A better way to implement this would be to set up a "Sales Dept Access" permission group :that *only* grants Sales department access, and nothing else

.Then do the same for the Support and Accounts departments, etc

Then set up a Trainee permission group, a Standard permission group and a Managers .permission group

:This lets you apply permissions like this
