PHP version

Christopher Nadeau - 2023-07-20 - Comment (1) - Deskpro Legacy

.The latest version of Deskpro requires PHP v5.5 or newer

For significant performance benefits, we recommend using PHP 7.4

If you receive an error message during installation that you are using an older version, the .only way to fix the error is by upgrading PHP

The process of upgrading PHP varies greatly depending on your server. You can always get the latest version from http://php.net/downloads.php and installation instructions are available in the PHP manual at http://php.net/manual/en/install.php

:Note

Most servers have installed PHP packages rather than PHP from a source that you can get :from the PHP website. Here is a list of further reading for a variety of platforms

- IIS on Windows: http://www.iis.net/learn/install
- /RedHat and CentOS: http://www.webtatic.com/packages/php53
- /Ubuntu and Debian: http://www.dotdeb.org/category/php
