

Using a Unix socket to connect to MySQL

Ben Henley - 2014-10-02 - Comment (1) - Deskpro Legacy

In some circumstances you may want to use a Unix socket to connect to the database: for example, if networking is disabled in MySQL

:To do this, use a setting like this in your config.php

```
;( 'define('DATABASE_HOST', 'unix_socket:/var/run/mysqld/mysqld.sock
```

.making sure the second parameter is **unix_socket:** then the correct path to the socket
