

## New Feature: Sync Users and Agents from Active Directory, LDAP or Databases

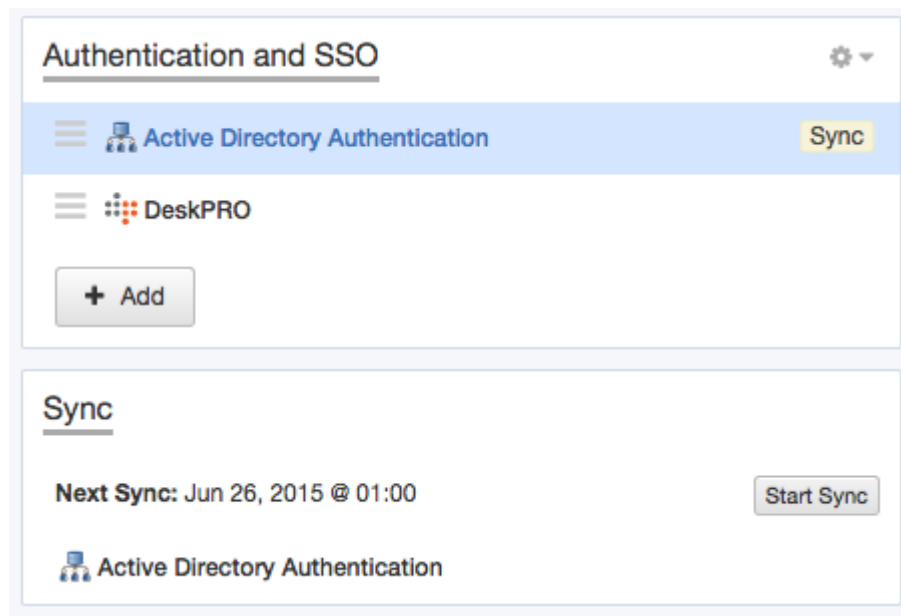

Ben Henley - Comment (1) - Product - 2015-06-25

Managing separate account details for each app your organization uses can be a huge drain on your time. If you ask each of your staff to juggle 37 different passwords, the chances are .that most of them will end up being '123456', or, at the very best, 'letmein

That's why Deskpro supports external authentication sources, so your agents and users can log in with their existing credentials from another system. It's one less password to .remember

If you're reading this, you're probably *already* aware that Deskpro can fetch account details .from **Active Directory, LDAP and 6 leading databases**. That's not the news

.The news is that we've now added **Auto Sync** for those sources

Your helpdesk can automatically update user or agent records, regularly syncing to make .(sure your account credentials are all up to date (you can sync manually at any time, too

Enabling Auto Sync for sources you've already installed is as easy as ticking a box and clicking **Save**

 **LDAP Authentication**

Enabled

☒ Yes, enable LDAP Authentication  
Enable the app once you have verified a

Enable Auto Sync

☒ Enable Auto Sync  
Routinely sync user information from this

.If want to set this up from scratch, see our documentation for [Active Directory](#) or [LDAP](#)

We'll be rolling out Auto Sync to Cloud accounts soon. (Deskpro On-Premise admins: update  
(your helpdesk to version #407 or greater to begin auto syncing straight away
