Show the full hierarchy of custom fields in dpql report output Collecting Feedback

- VS Victor Salgado
- **Forum name:** #Feature Request

If you pull a very basic report exporting data on tickets with custom fields, e.g

```
DISPLAY TABLE
```

```
SELECT tickets.date_created, tickets.id, tickets.custom_data[5]
```

```
FROM tickets
```

If you have a lot of parent and child fields, it will only `_render_child` field. If you have two selections "Tech Qs > Other" and "Billing Qs > Other" - in the report, it will only output "Other" - ideally there is a function to run to "render as raw" so you can toggle between just that output, or the full output. It can become quite confusing in larger reports.
