

Ticket Triger [Email body] "contains" input validation Report

• Adam Miner

When attempting to use the criteria of "Email Body" containing "Example Text", the form to create a trigger fails validation and will not allow saving the new trigger.

I am able to workaround with regex (Screenshot attached), but the validation when using the more user-friendly "contains" operator would be preferred.

Additional details to reproduce:

Title: "Example Text"

Event: [Defaults for] "New Ticket"

Criteria: Screenshot attached where regex field does not fail validation, whereas the

"contains" filter does fail validation

Actions: Unset
