

Configure a proxy server for HTTP requests made by Deskpro

Christopher Nadeau - 2021-01-21 - Comments (1) - Server Software

In some situations, Deskpro itself may make HTTP requests: Downloading updates, executing a webhook, consuming web APIs such as with the JIRA app, etc.

Starting with Deskpro v5.2.0, you can make Deskpro use a proxy server for these HTTP requests by editing `config/advanced/config.settings.php` and adding one of these three configuration variants:

```
$SETTINGS['http_client'] = [  
    'proxy' => 'http://localhost:8125',  
  
    // or  
    'proxy' => 'tcp://localhost:8125',  
  
    // or  
    'proxy' => [  
        'http' => 'tcp://localhost:8125', // Use this proxy with  
"http"  
        'https' => 'tcp://localhost:9124', // Use this proxy with  
"https",  
        'no' => ['.mit.edu', 'foo.com'] // Don't use a proxy  
with these  
    ]  
];
```

Do you need to restart deskpro after making these type of changes in config files ?
