

## How do I send a different auto-reply to new users?

Ben Henley - 2018-03-14 - Comments (0) - Using Deskpro

Suppose the sales team want to customize the email auto-response when tickets are submitted to the Sales department. They want to send existing users the normal response, but they want new users to get a more elaborate welcome email explaining your product range.

We'll assume you start out with your sales@ account linked to the Sales department with simple **new ticket** triggers, configured to send the the default auto-response.

This **Email Account Trigger** sets tickets sent via the sales@ account to the Sales department, then sends the auto-response.

The screenshot shows the Deskpro configuration interface for triggers. On the left, a list of 6 triggers is shown, with the '1 Email Account Trigger' selected and highlighted in blue. Below this list, a text box explains that triggers can be used to perform actions based on the email address of a user sending a new ticket, with the example email address 'sales@a1corp.example' entered. On the right, the configuration for the selected 'Email Account Trigger' is displayed. The trigger name is '\*sales@a1corp.example\* Email Account Trigger'. Below the name, a description states: 'This is an email account trigger. It will apply when a user submits a new ticket by sending an email to this email address.' The configuration is divided into three sections: 'Criteria', 'Actions', and 'Send User Email'. The 'Criteria' section has a 'when' condition: 'The following conditions are met:' followed by an 'if' condition: 'The user created a new ticket by emailing \*sales@a1corp.example\*'. The 'Actions' section has a 'then' condition: 'The followings actions will run:' followed by a checked 'Set Department' action with 'Sales' selected in a dropdown menu. The 'Send User Email' section is checked and includes a 'Template' dropdown set to 'New Ticket Auto-Response', an unchecked 'Include CC's' checkbox, a 'From Name' dropdown set to 'Site Name (A1 Inc)', and a 'From Email' dropdown set to 'The account set on the ticket'. At the bottom of the configuration area is a green 'Action' button.

This **Department Trigger** sets tickets submitted via the web where the user has selected the Sales department to the sales@ email account, then sends the auto-response.

**6 Triggers**

- Enable email validation
- Check email validation
- Check agent validation
- 2 Department Triggers**

Use these triggers if you want to perform actions based on the department a user selects when submitting a ticket from the web interface.

**Support**

**Sales**

- 1 Email Account Trigger**
- Send agent notifications
- Send user new ticket by agent
- Assign self when replying by email

**+" Add**

---

**"Sales" Department Trigger**

This is a department trigger. It will apply when a user submits a new ticket from the web interface and selects

**Criteria**

**when** The following conditions are met:

- if** Department is "Sales"
- and** Ticket is created by a user from the web interface

**Actions**

**then** The followings actions will run:

- Set Email Account sales@a1 corp.example
  - Template: New Ticket Auto-Response
  - Include CC's:  CC in all additional user participants.
- Send User Email
  - From Name: Site Name (A1 Inc)
  - From Email: The account set on the ticket

**+ Action**

The simple triggers can't do what the sales team wants, because their criteria are fixed, so there's no way to specify that you only want to do something to new users.

Instead, you would create a new trigger:

This trigger is checked when a user or agent submits a ticket via email or web. (We'll assume that you don't want to send acknowledgements for tickets created using the API).

The criteria you would use are:

**Criteria ?**

**when** The following conditions are met:

- Department is Sales
- User is new

**+ Criteria**

That means the new trigger will only run its actions when the department is Sales, and the

user is new. We're going to rely on the **Email Account Trigger** to set the department to Sales. Make sure the new trigger is below the simple triggers.

The action you want to run is sending a custom email. You would create a custom email template (see the chapter on [Editing Templates](#) for details), then run it like this:

**Actions** ?

**then** The followings actions will run:

Send User Email	Template:	new-user-sales-welcome.html
	Include CC's:	<input type="checkbox"/> CC in all additional user participants.
	From Name:	Site Name (A1 Inc)
	From Email:	The account set on the ticket

**Action**

You don't want users receiving more than one auto-response email when they submit a new ticket. So you would disable the **Send User Email** action for the simple triggers:

<p><b>Actions</b></p> <p><b>then</b> The followings actions will run:</p> <p><input checked="" type="checkbox"/> Set Email Account sales@a1 corp.example</p> <p><input type="checkbox"/> Send User Email</p> <p><b>Action</b></p>	<p><b>Actions</b></p> <p><b>then</b> The followings actions will run:</p> <p><input checked="" type="checkbox"/> Set Department Sales</p> <p><input type="checkbox"/> Send User Email</p> <p><b>Action</b></p>
-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

We're almost done. But we want users who don't receive the custom email to receive the default auto-response email. Since the simple triggers aren't sending that any more, we need another new trigger to do the job.

We could try to set up a complicated set of Criteria so that the new trigger runs if the user is not new and the department is Sales, or the department is anything else, but there's a simpler way. We can just put in a check to see if the custom email has already been sent, and make sure the default auto-response trigger is below the one that sends the custom response.

## Criteria ?

**when** The following conditions are met:

The user has NOT been emailed  a specific email template

**+ Criteria**

## Actions

These actions will apply when all of the criteria pass.

**then** The followings actions will run:

Send User Email	Template:	<input type="text" value="New Ticket Auto-Response"/>
	Include CC's:	<input type="checkbox"/> CC in all additional user participants.
	From Name:	<input type="text" value="Site Name (A1 Inc)"/>
	From Email:	<input type="text" value="The account set on the ticket"/>

**+ Action**

Here's the completed triggers in the right order:

- 2 Department Triggers
- 1 Email Account Trigger
- Welcome email to new users
- Send default auto-response
