## Snippet variables now support more custom fields

2023-02-14 - Lara Proud - Comments (0) - Product (Agent)

We've added support for more custom field types to be inserted as variables when using Snippets.

So you can now create a Snippet with variables that will insert different field types. The following list details the different field types and the values that can be inserted:

- Single-line Text
- Multi-line Text
- Number
- Select
  - Single-select
  - Multi-select
- Toggle
- Date
- Date & Time
- Hidden
- URL
- Currency
- File

To see what values will be inserted into the message when using the variable, see the <u>Snippet Variable</u> section of the Agent Guide.
