Enable smart-parsing of emails forwarded into the helpdesk by users Collecting Feedback

- OJ Olegario
- Forumo pavadinimas: #Feature Request

We would like this option to be availble for non agents as well:

Ticket Forwarding — Inbound
When an agent forwards an email from their own email indox into the helpdesk, Destgro can parse the message to create a new ticket for the user the original email was from. This makes it easy for agents to enter new tickets into the helpdesk via email on behalf of other users who may be emailing them.
Read more about this feature in the Destgoro knowledgebase
Enable smart-parsing of emails forwarded into the helpdesk by agents
😰 Treat any text above a forwarded email as a note (visible to agents only) instead of a reply to the user
Use a custom Subject regular expression for detecting forwarded emails
Ticket Forwarding — Outbound
These settings control how individual ticket messages are forwarded out of the helpdesk using the "Forward Message" function from the Agent Interface. This feature is available from the gear menu on each message in a ticket.
Ticket Account
Account used by the total vertice of the second sec
Allow agents to send from their own email address
When enabled, the agent will have a choice of sending "From" their own email address. For example, you could set the "From" address to isolegariagerect.c.a instead of the email account selected above. This would allow the recipients to reply back to you directly (i.e. thereby moving the conversation out of the helpoest).
