Improved Ticket List

2014-03-05 - Christopher Nadeau - [Kommentarer \(2\)](#) - [Product](#)

In DeskPRO #317, a lot of work has gone in to making the ticket list faster and smoother.

The screenshot displays the DeskPRO ticket list interface. At the top, there's a navigation bar with 'TICKETS' and a search icon. Below this, a sidebar on the left shows a tree view of ticket categories: 'My Tickets' (13), 'Support' (3), 'Sales' (10), 'Tickets I Follow' (5), 'My Team's Tickets' (0), 'Unassigned Tickets' (82), 'All Tickets' (110), 'None' (66), 'Support' (34), and 'Sales' (10). Below the sidebar, there are tabs for 'TICKETS', 'LABELS', and 'FLAGGED', with counts for 'Awaiting Agent' (110), 'Awaiting User' (150), 'Resolved' (77), 'Awaiting Validation' (0), 'Spam' (0), and 'Recycle Bin' (~1).

The main content area shows a list of 13 tickets, ordered by 'Urgency DESC' and grouped by 'Category'. The list includes ticket numbers, subject lines, and sender information. For example, the first ticket is #291 with subject 'dignissim dictum in' from 'orci libero'. Other tickets include #459, #472, #540, #669, #673, and #717. Each ticket entry shows the department (Sales), category (CatA), and date created. The interface also features a '0 selected' status at the top of the list and a 'Showing 1 to 13 of 13' indicator at the bottom.

Faster real-time updating

The list now responds to changes faster and more accurately. Tickets are added and removed from filter results in near real-time. No more distracting loading screens.

Correct sort order

As new tickets are added or updated in real-time, their position within the list is kept accurate. For example, if you are sorting by urgency and the ticket urgency changes, the position of the ticket in the list will change as

well.

Pausing real-time updates

It is now possible to completely pause real-time updates by clicking the icon near the top right of the list. If a change happens while the list is paused, DeskPRO will show you a notice:

Real-time updates with mass actions

While working with mass actions, DeskPRO enters a “limited” real-time update mode. Ticket properties are kept up-to-date in the list and tickets are automatically removed, but no new tickets are added.

This means the list you are working on stays the same so long as you have mass actions open. It makes it easier to work with mass actions on busy helpdesks where other agents may be interacting with tickets at the same time as you are trying to perform mass actions.

Ticket Previews

Hover your mouse over a ticket subject link and a preview tooltip appears:

Good to see pictures and additional information regarding the update. Sometimes the release notes are less informative.

Very nice improvements. Now if only there were a first-page last-page capability. << < 3 > >> would be nice. << < 1 2 3 4 17 > >> would be even nicer.
