Slack App: Set individual webhooks / channels per Trigger Collecting Feedback

- Timo Heil
- **Ime foruma:** #Feature Request

Currently it's only possible to set a global webhook for the Slack app/widget, meaning you can only trigger a message to one single Slack channel. Please extend the app to support individual webhooks/channels per Trigger, since different teams usually use different Slack channels. Thanks!

Important one for us - or integrate with the API? In our instance we often want specific organisation's support tickets going to a specific room, for example, or sales going to one room and support to another.

I think this has changed - I can set the channel into which I post based on the specific trigger.

Yap, seems like you get the webhook address from one channel from slack, but them when you are creating actions, you basically can send it to any channel, u just need to name the channel starting with #
