## My custom report with a lot of fields is failing

Ben Henley - 2019-04-01 - Kommentarer (0) - Creating Reports (Old)

## Question:

I'm trying to run a custom report I made that retrieves a lot of different fields including custom fields I've created. Once I add more than a certain number of fields, my query fails with a "There is something wrong with your query" message. What's happening?

## Answer:

DPQL queries with more than about 55 fields will fail due to a limitation in the underlying MySQL technology. If you need to retrieve a large number of fields, you will need to use the <u>Deskpro API</u>.

Note that you can retrieve all fields in a table with a wildcard, e.g.

SELECT tickets.\*

but this will not work if you have added so many custom fields that you're running into the above issue.
