## New Feature: Web Hook Variables

2014-11-03 - Ben Henley - [Yorumlar \(0\)](#) - [Product](#)

Web hook actions enable your automatic processes, like triggers, to call external services using the web's HTTP protocol. This means that with a little technical know-how, you can have DeskPRO talk to other web services: your helpdesk could post alerts on your intranet, or your web service could alert users when they have a ticket reply.

We've now added support for [variables](#), so you can customize the HTTP headers and parameters with details of the ticket and provide more precise information to external services.

|                 |                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------|
| Custom headers: | <div>X-Custom-Header: acme1<br/>X-Deskpro-TicketAgentTeam: {{ ticket.agent_team.name }}</div> |
| Custom data:    | <div>{{ ticket.id }} , {{ ticket.subject }} , {{ ticket.department.title }}</div>             |

To use a web hook, just go to your admin interface and add a **Call Web Hook** action to a trigger, SLA or escalation.

See our admin manual for more details about [web hooks](#).
